What is object-oriented programming?

Object-oriented programming (OOP) is a programming paradigm that uses "objects" to design applications and computer programs. "Objects" are data structures consisting of data fields and methods together with their interactions. This makes it easier to create complex programs that are easier to maintain and reuse.

Why use OOP?

There are many benefits to using OOP, including:

- **Increased code reusability:** OOP allows you to reuse code across different applications, which can save you time and effort.
- **Improved maintainability:** OOP makes it easier to maintain your code, as you can easily change or update individual objects without affecting the rest of the program.
- **Enhanced extensibility:** OOP makes it easy to extend your programs with new features and functionality, as you can simply add new objects to the program.
